Práctica 4 Analizador de Trama LLC

Redes de Computadoras

Laura Andrea Morales López MSc. NIDIA ASUNCIÓN CORTEZ DUARTE

Abril 2018

Resumen

In this report we will see an analysis of LLC frames and a program to do it quickly.

1. Indroducción: Control de enlace lógico

El protocolo LLC (control lógico de enlace) es un protocolo de capa de enlace de datos derivado de HDLC, del cual hereda su campo de control, y fue estandarizado por la IEEE bajo la denominación 802.2. Igual que en HDLC se tienen tramas de información, supervisión y no numeradas distinguiéndose entre ellas por los bits menos significativos de su campo de control.

Tenemos la siguiente cabecera:

Con esta podemos analizar tramas de este tipo.

2. Problema

Realizar este tipo de análisis en muy especifico y fácil de realizar, sin embargo tiende a los errores humanos.

Como vimos en la cabecera tenemos los boques de la información y sus respectivo significados con lo cual podemos leer de alguna manera lo que nos estan diciendo las tramas.

3. Hipotesis:

Una cabecera LLC puede ser leída de manera secuencial, por lo tanto es posible programar la lectura del las mismas.

4. Software

• Librería stdlib.h

- Librería stdio.h
- Librería stdbool.h
- Librería string.h

5. Procedimiento

- Se analiza cada trama por separado
- Procesamos el campo de control que se encuenta el en byte 17.
- Checamos el tipo de trama que tendremos, para esto realizamos un & con 3.
 - Si es un 0 o un 2 entonces es de Información. En este tipo de trama la cabecera de 2 bytes es de la siguiente marera con lo que realizando unicamente un corrimiento de >> 1 podemos obtener N(s) del byte 17 o N(R) del byte 18. Y además obtenemos el P/F con un &1.

• Si es un 1 tenemos una trama de Supervisión.

Con esta trama podemos obtener el valor del comando realizando un corrimiento >> 2 y luego un &3.

Despues checando el P/F podemos determinar si es necesario char el SAPd para saber si es comando o respuesta Si P/F=1 chacamos el Sap (byte 16) y si es 0 es Comando y si es 1 es Respuesta.

El P/F lo podemos obtener realizando un & 1 en el byte 18.

Y el Sap con un & 1 con el byte 16.

Con esto tenemos la posicón del comando o respuesta a usar dependiento de la siguiente tabla.

SS	Bits	Comando	Significado
0	00	RR	Receptor Listo
1	01	RNR	Receptor no listo
2	10	REJ	Rechazo
3	11	SREJ	Rechazo selectivo

• Si es un 3 tenemos una trama Sin numerar. Como en la de supervisión checamos el P/F y el SAP y con corrimientos y and's: ((byte17 >> 2)&3)|((byte17 >> 3)&28) podemos obtener los números MM y con la siguiente tabla podemos obtener su significado.

M M M P/F M M 1 1

M	Comando	Respuesta	Sig.Com	Sig.Res
0	UI	UI	Unnumered Information	Unnumered Information
1	SIM	RIM	Set Inicialization Mode	Request Inicialization Mode
3	SARM	DM	Modo Desconectado	
4	UP		Unnumered Pull	
7	SABM			
8	DISC	RD	Disconect	Request Disconect
11	SARME			
12		UA		Unnum. Acknow.
15	SABME			
16	SNRM		${\bf Set Normal Response Mode}$	
17		FRMR		
19	RSET			
23	XID	XID	Ex.Station Identif.	Ex. Station Identif.
27	SNMRE			

• Mostrar la información obtenida de cada trama.

6. Resultados

Tenemos los siguientes resultados:

7. Conclusión

Realizar este tipo de programa evita tener que realizar operaciones que tienden a error humano, tales como olvidar un bit o colocar alguno demás, ademas de así mejorar el tiempo en que se realizaría.

Como se vió mecanizarlo es sencillo por su orientación a bits con ello podemos analizar muchas tramas de manera rápida.

8. Código

```
#include <stdlib.h>
           #include <stdio.h>
            #include < stdbool.h>
           #include <string.h>
